INSTALLATION MANUAL FOR JABIRU 3300 AIRCRAFT ENGINE

DOCUMENT No. JEM3302-7

This Manual is a guide to correctly install the Jabiru 3300 engine into an airframe.

If you have any questions or doubts about the contents, please contact Jabiru Aircraft P/L.

Applicable to Jabiru 3300cc Engines, S/No. 33A961 Onwards (Hydraulic Lifter Type) (Including 33A927, 33A928, 33A947, 33A948, 33A949, 33A950)

Issue Notes:

Original Issue
Original reside
Re-Format
Change drawing (page 38)
Change EGT probe position from 100 to 120mm (page 36)
Update engine limits.
Change instrument requirements to include CHT and EGT on each cylinder.
Correct Oil pressure limits
Remove Gull Wings from Figure 50
Extra note on oil cooler hose fitment
Add note for Stator leads to be different lengths (section 4.1)
Correct oil pressure 525 kPa max, 350 kPa optimal
Correct Fahrenheit values for EGT's
Add note for no aerobatic manoeuvres

Most recent changes shown in red text.

Jabiru Aircraft Pty Ltd Installation Manual Jabiru 3300 Aircraft Engine

Description

1.3 Model

This Manual applies to all Jabiru 3300 Engine Models, but particularly those from S/No 961 on. Details for operating and servicing are supplied in the Engine Instruction & Maintenance Manual.

Only those details relevant for installation are duplicated below – for all other information please refer to the Instruction & Maintenance Manual.

1.4 Manuals

Instruction and Maintenance Manual Installation Manual Parts Catalogue

1.5 Specifications

All information given in this manual assumes static sea level ratings under the following conditions:-

- International Standard Atmospheric conditions at sea level.
- Aircraft service equipment drives unloaded. (Vacuum Pump not fitted)
- Full rich fuel/air mixture.
- Standard Jabiru air filter and hot air mixer box assembly.
- Standard exhaust muffler.
- Jabiru Propeller
- Jabiru Airframe

REVISION	0	1	2	3	4	5	6	7		Dated: 1 st Dec 2016	Page: 5 of 56

Installation Manual

Jabiru 3300 Aircraft Engine

1.5.1 Engine Models

- The 3300L engine has a maximum continuous RPM rating of 2850RPM. The engine may be operated at engine speeds above 2850RPM for up to 10 minutes.
- All other engine specifications and limitations are identical to other 3300 models (such as the 3300A).
- The 3300L uses the same parts, Parts Books, Servicing, Maintenance and Overhaul Information as other 3300 models.
- Unless specifically stated otherwise, all Service Letters, Service Bulletins, Manufacturer Safety Directions and other service information issued for Jabiru 3300 engines is applicable to 3300L models.

1.5.2 Engine Ratings

Table 1 - Engine Ratings

Model:	3300L	All Other 3300 Models						
Maximum Power	90 kW (120 hp) @ 3300 RPM - ISO STD Conditions							
Fuel Consumption	35 L/hr @ Takeoff Rating	35 L/hr @						
	26 L/hr @ Continuous Rating	Takeoff/Max Continuous Rating						
Oil Consumption	0.1 L/hr (max)							

Note that fuel and oil consumption figures are based on a typical installation in a Jabiru Aircraft. Values will differ for other installations.

1.5.3 Fuel

Fuel Consumption:	.35 L/hr @ Takeoff Rating
Fuel Consumption:	. 24 L/hr @ 75% nominal power setting.
Fuel Pressure to Carburettor Maximum	. 20 kPa (3 psi)
Fuel Pressure to Carburettor Minimum	. 5 kPa (0.75 psi)
Recommended Fuel Grade	Avgas 100LL & Avgas 100/130

Note: Leaded and Unleaded Automotive Gasoline above 95 Octane RON may be used, however due to the lack of a strong quality control system for automotive fuels Jabiru Aircraft recommend using AVGAS wherever possible. For more details on fuel refer to the latest issue of the service letter JSL007.

1.5.4 Oil

Oil Capaci	ty									3.5 Litres			
Oil – Minin	num T	emp	erati	ure 1	for T	ake	-Off.			40°C (122°F)			
Oil – Maxir	mum F	eak	Oil	Tem	per	ature	e			118°C (244°F)			
Oil –Continuous Temperature Limits 80°C – 100°C (176°F - 212°F)													
Oil Pressure – Normal Operations										Min 220 kPa (32 psi)			
								Max 525 kPa (51 psi)					
										Optimal 350 kPa (51 psi)			
Oil Pressu	re – Id	le								Min 80 kPa (12 psi)			
Oil Pressu	re – St	artir	ıg &	Wa	rm l	Jp				Max 525 kPa (76 psi)			
										Optimal 350 kPa (51 psi)			
Oil Consur	mption									0.1 L/hr (max)			
Oil Standa	rd									Aircraft engine oil - complyi	ng with		
										SAE standard J-1899, or			
										Lycoming Spec. 301F, or			
										Teledyne - Continental Spec	MHF-24B		
	(for	mor	e de	tails	on	oil s	elec	tion	see	Engine maintenance manual)

Installation Manual

Jabiru 3300 Aircraft Engine

1.5.5 Additives

Note: No Oil or fuel additives should be used. Use of oil or fuel additives will void warranty.

1.5.6 Cylinder Head Temperature (CHT)

Note: Time with CHT at between 180°C and 200°C is not to exceed 5 Minutes

1.5.7 Exhaust Gas Temperature (EGT)

 EGT Max (Mid-Range / Cruise):
 740°C (1364°F)

 EGT Max (Above 70% Power):
 700°C (1292°F)

 EGT Min (Above 50% Power):
 600°C (1112°F)

Note: An EGT gauge is included as standard equipment on the Jabiru factory built aircraft, for other installations it is required equipment.

1.5.8 Ground Running Limitations

Ground Oil Pressure - Idle / Startup...... Min 80 kPa (11 psi)

...... Max 525 kPa (76 psi)

Ground Maximum Cylinder Head Temperature...... 180°C (356°F)

Note: If ground temperature limits are reached, shut the engine down or cool it by pointing the aircraft into wind.

1.5.9 Aerobatic Manoeuvres

The engine is not approved for aerobatic manoeuvres

¹ Measured with sensor ring fitted under exhaust spark plug.

Jabiru Aircraft Pty Ltd	Same
Installation Manual	Jabiru 3300 Aircraft Engine

1 Engine Mount

The design of the engine mount must balance many requirements:

- The mount must be strong enough to carry the loads applied by the weight and power of the engine.
- The mount must be stiff enough that the engine does not sag or move too much when power is applied.
- The mount must position the engine at the correct height and angle so that the engine's thrust line suits the aircraft. In most installations, Jabiru Engines need to have their thrust axis offset to the right (tractor installations) by between 1° and 2°.
- The mount must position the engine at the right place. The weight of the engine is a very significant part of the overall aircraft weight, and it's position must be calculated to place the centre of gravity of the aircraft (CG) in the right spot.
- The mount must be designed to allow enough room for the air intake to the Carburettor as well as accessories like vacuum pumps. Access for maintenance must also be considered.
- The final design of the engine mount is a compromise, and sometimes special parts will be required to make it work. For example to give a good CG location the engine may have to be mounted as close to the firewall as possible. This meant that custom air intake tubes will be required to get the intake air to the carburettor with a minimum disturbance and turbulence.

The engine has four engine mounting points located at the rear of the engine (shown in Figure 1 or Figure 4) from which the engine is to be mounted. An optional bed mount may be fitted.

Figure 4. Engine Mount Point Locations

- Each engine mounting point is rubber mounted to damp the engine vibrations. The correct installation of these rubbers is shown below Figure 42.
- If required, corrections of the engine angle or propeller position can be made by fitting spacers under the rubber cushions. The maximum spacer thickness on any one mount is 3mm.

2 Controls

This section comprises of the mechanical controls and electrical switches.

2.1 Throttle and Choke

- The throttle and choke cables both attach to the cable mount arm fitted to the carburettor.
- Note: Since a pressure compensating carburettor is used there is no mixture control.
- The cables for the choke and throttle can be adjusted using the adjuster screws and nuts shown in Figure 7.
 A 7mm spanner is required.
- The cables used must have an adequate radius wherever they turn a corner. Bending the cables too sharply
 will increase the cable friction, making it difficult to use the control accurately. This is a particular problem
 for the throttle cable as it will make setting the idle accurately very difficult.
- All Jabiru engines are run-in on a Dynamometer before delivery. It is impossible to accurately set the idle RPM when the engine is on the dynamometer, so the Idle Stop Screw (shown in Figure 7) must be adjusted as a part of the engine installation process.

Figure 7. Choke and Throttle Connections to Carburettor

2.2 Ignition & Starter Systems

- The only electrical controls for the Jabiru Engine are the ignition switching and the start button.
- The ignition switches and starter system wiring are connected as shown by the circuit diagram, Figure 27.
- Section 4 gives details of the electrical systems for the engine.

Installation Manual

Jabiru 3300 Aircraft Engine

3 Engine Crankcase Breather, Catch Bottle & Dipstick

- The Jabiru 3300 engine has a crankcase breather connection built into the dipstick housing. This is to be connected as shown in Figure 8 below.
- The catch bottle is designed to catch most oil vapour from the crankcase breather air. It must be monitored in service and periodically emptied of waste oil.
- Figure 58 shows more clearly the outlet from the catch bottle the catch bottle outlet is secured in the cowl outlet. The position of this outlet and the catch bottle itself must be assessed and oriented so that the crankcase of the engine is exposed to pressure close to ambient. If the breather is open to a high or low pressure (partial vacuum) area the pressure inside the crankcases will also change, with unpredictable effects on engine oil consumption, and oil flow within the engine. This is because several areas of the engine are lubricated via low pressure or spray oil feeds, and drained by gravity pressure differences cause airflow changes, and modified airflow can significantly affect the oil feeds in these areas.
- When installed in a tail-dragger aircraft, re-calibration of the dipstick will be required by the owner so that it can be read accurately with the aircraft sitting on it's wheels.

Figure 8. Crankcase Breather Installation

Installation Manual

Jabiru 3300 Aircraft Engine

4 Electrical Equipment

4.1 Alternator

- The alternator fitted to the Jabiru 3300 engine is a single phase, permanently excited with a regulator.
- The rotor is mounted on the flywheel and the stator is mounted on the alternator mount plate at the back of the engine. The alternator mount plate is also the mount for the ignition coils and the vacuum pump.
- Note: The electrical system is Negative Earth
- The Alternator stator leads must be of different lengths (at least 25mm difference). This helps to ensure an electrical short between the two leads cannot take place between connectors (see Figure 10)

Specifications

Power (Max): 200W Continuous

Figure 9. Ignition & Alternator Detail

Figure 10 - Alternator leads must be of different lengths

Installation Manual

Jabiru 3300 Aircraft Engine

4.2 Regulator

- The regulator has been selected to match the voltage and current of the integral alternator. Only Jabiru Part No. PI10652N should be used. (The regulator output voltage is 14 volts + 0.8 volt.).
- Recommended wiring of regulator is positive and negative of the regulator directly to the battery. A 20A fuse
 or circuit breaker may be used between the regulator & battery
- The regulator is equipped to illuminate a Low Voltage Warning Light. Refer to Figure 12 for plug pin details.

Figure 11. Electrics Installation to Firewall

Installation Manual

Jabiru 3300 Aircraft Engine

4.3 Ignition

- The ignition unit is a dual breakerless transistorised ignition with the magnets mounted on the flywheel and the coils mounted on the alternator mount plate. Figure 9 shows the coils of a Jabiru 6-cylinder engine.
- The current from the coils flows to the distributor from where it is distributed to the spark plugs.
- The ignition is turned OFF by grounding the coils via the ignition switches. This is the reverse of most electrical systems: when the ignition switch is in the open (not connected) position the coil is LIVE and will fire. Wiring details are shown in Figure 26.
- The ignition is timed to 25° BTDC. Ignition timing is fixed it is set by the position of the flywheel magnets relative to the crankshaft.
- The temperature limit for the ignition coils is approximately 70°C. This should be checked by the installer. It is recommended that pipes of 12mm dia be fitted to the top rear of each air duct directing air onto the coils for cooling purposes.
- Coil gaps are set at 0.25mm to 0.30mm (0.010" to 0.012").
- When installing new ignition coils the output leads go in the directon of prop rotation. RHS coil output lead
 is up LHS coil output lead goes down See Figure 9.

Figure 13. Ignition Coil Cooling Tube

4.4 Starter Motor

- The starter is mounted on the top of the engine and drives the ring gear on the flywheel.
- The motor is activated by engaging the starter button (the master switch has to be ON) which trips the solenoid, hence current flows from the battery to the motor.
- The cable from Battery to starter should be minimum 16mm² copper.
- Wiring details are shown in Figure 26.

4.5 Starter Solenoid

- The starter Solenoid is mounted on the firewall as shown in Figure 11.
- The Solenoid body forms a part of the electrical circuit and MUST be earthed to function correctly.

REVISION	0	1	2	3	4	5	6	7	Dated: 1 st Dec 2016	Page: 16 of 56
----------	---	---	---	---	---	---	---	---	---------------------------------	----------------

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 14. Starter Wiring Details

4.6 Battery

- The battery should be of a light weight, 12V, 20 Ah type able to accept a charging voltage up to 14 V (+ 0.8V) and a 30 AMP Input.
- For optimum starting the battery used must have a high Cranking Amp Capacity (also known as Pulse Amp Capacity). The standard battery used by Jabiru Aircraft has a Pulse Amp rating of 625 Amps. Batteries with higher Pulse Amp ratings may be used and will improve engine starting in colder climates.

4.7 Wiring Practices

- Using aircraft grade wiring is strongly recommended. Compared to other grades of wire aircraft grade can carry higher currents for the same physical size and weight. The insulation used on aircraft grade wire is also frame resistant and is designed for better resistance to damage caused by chaffing or rubbing.
- Care should be taken to identify each wire via labels or similar. This makes troubleshooting electrical issues much easier.
- Wherever possible wires should be identified as carrying "Power" or "Earth". This can be done by using
 different colour connectors or applying rings of coloured heat-shrink during assembly. Again, this step
 simplifies troubleshooting or later modification.
- Wires should be laid out in bundles and supported along their length to prevent failures due to fatigue.

Installation Manual

Jabiru 3300 Aircraft Engine

4.8 Instruments

4.8.1 Electronic Tachometer

- General wiring information for the Tachometer is given in the Wiring Diagram, Figure 26. Detailed instructions on it's installation are supplied by the instrument manufacturer.
- The tachometer picks up on 2 metal tabs attached to the inside of the flywheel.
- The Pickup used is a Magnetic Induction sender type. It is a passive device requiring no external power.
- They Pickup outputs a voltage in response to variations in their self-induced magnetic field caused by proximity to moving ferrous metal parts (such as the tags fitted to the rear of the flywheel).
- The Tachometer sender must be adjusted to have approximately a 0.4mm gap between the tip of the sender and the tag. Note that due to normal bearing clearances the crankshaft moves slightly when the engine is running, so if this gap is set too small the sender will hit the tag. The sender is fragile and most times damage like this means that the sender must be replaced. If the gap is different for each of the two tags then one tag can be carefully bent to be the same as the other.
- Ensure gauge is reading correctly. While large errors will be obvious, smaller errors are harder to pick and it
 is recommended to check the gauge reading with another instrument (such as a hand-held optical proptach).

Jabiru 3300 Aircraft Engine

4.8.2 Oil Temperature Gauge

- The Oil Temperature Gauge uses an electric probe mounted in the base of the sump. Jabiru Part No. PI10752N is recommended.
- The gauge has 3 pins, one marked "+" which is connected to power, one "S" which is connected to the sensor and one un-marked which is connected to earth.
- The temperature sender is a brass fitting installed in the engine sump beside the drain plug.
- The oil temperature relies on a good earth connection between the sensor, the engine and the airframe earth terminal. If there is excess resistance at any of these points gauge reading errors will occur.

Figure 17. Oil Temperature Sender

Figure 18. Oil Temperature Connections

Installation Manual

Jabiru 3300 Aircraft Engine

4.8.3 Oil Pressure Gauge

- An electric oil pressure sender is fitted to the engine for an Oil Pressure Gauge. Jabiru Part No. Pl10762N is the recommended gauge.
- The gauge has 3 pins, one marked "+" which is connected to power, one "S" which is connected to the sensor and one un-marked which is connected to earth.

Figure 19. Oil Pressure Sender

Figure 20. Oil Pressure Connections

4.8.4 Voltage Gauge (Optional)

- A voltage gauge can be connected to the aircraft systems.
- The gauge has 2 pins, one marked "+" which is connected to power and one un-marked which is connected to earth.

Figure 21. Voltage Gauge Connections

----------	---	---	---	---	---	---	---	---	--	---------------------------------	----------------	--

Installation Manual

Jabiru 3300 Aircraft Engine

4.8.5 Cylinder Head Temperature Gauge

- The Cylinder Head Temperature Gauge uses a thermocouple which is installed to the screw between the spark plugs or under exhaust spark plug of each cylinder head. CHT probes fitted under the spark plug are susceptible to reading errors if not positioned concentrically. It is highly recommended that that CHT probes by fitted instead on the bridge between the two plugs (as shown in Figure 24).
- The head temperatures of air cooled engines are typically quite variable differences of 50°C (90°F) between the hottest and coolest head are not uncommon. Refer to Section 12 for additional information on cooling.
- For a new installation an audit must be done to establish which is the hottest cylinder. The CHT thermocouple probe is then fitted under the exhaust spark plug on that cylinder. Cylinder number 4 often runs hottest in normal tractor installations, however for new installations this MUST be checked and confirmed. Jabiru Part No. PI10732N is the recommended gauge.
- Care must be taken when installing the spark plug terminal the terminal must be aligned with the spark plug. If the terminal is not aligned the spark plug seal will be poor and hot combustion gasses can leak out. These very hot gases will cause the thermocouple to mis-read and show high CHT's. Figure 23 shows properly and improperly fitted CHT terminals.
- If thermocouple cable is too long it must be looped as many times as necessary and strapped behind the instrument panel or to the engine mount.

DO NOT CUT TO LENGTH

The Thermocouple sensor works by reading small voltages generated by the sensor wires, and cutting the wire upsets the instrument's calibration.

- Ensure that wire is not chaffing on the fibreglass air duct or cooing fins.
- No power connection is required for analogue gauges the instrument reads directly off the voltage created by the thermocouple wire.
- Follow manufactures instructions when installing gauges, they will have specific installation requirements.
- Temperature of the cold junction for best results should be around 50°C. Ensure cold junction is mounted as far from the thermo couple probe as possible.

Figure 22. CHT Sender (Thermocouple) Installation

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 23. CHT Terminal Installation

Figure 24. CHT sensor between plugs

4.8.6 Exhaust Gas Temperature Gauge

- Exhaust gas temperature (EGT) probes are to be fitted to each cylinder. The probe should be positioned 120mm from the port flange on the exhaust pipe of each cylinder.
- It is important that this distance is accurately measured. Accurate positioning allows true comparison between cylinders.
- As the EGT probes as also thermocouples, as with the CHT, do not cut the wires shorter.

4.8.7 Engine monitoring systems.

- When installing Engine monitoring systems always follow the manufactures instructions.
- There is alternative means of getting a tacho signal, such as from the alternator or coils. See EMS manufacture or Jabiru aircraft for details.

Installation Manual

Jabiru 3300 Aircraft Engine

4.9 Radio Frequency (RF) Noise Reduction

- RF noise is a common problem with aircraft. Symptoms include:
 - i. Radio squelch setting needs to be high
 - ii. Excess noise in the background during transmissions
 - iii. Squeals or other feedback noises heard during transmission
 - iv. Intermittent static or noise breaking through the squelch.
- RF noise is a complex problem and is influenced by many different factors. The following points do not contain everything there is to know about RF noise, but they are given as recommendations of general good practice to minimise it's effect.
- Ensure all connections, particularly engine earths, are clean and un-corroded.
- If the aircraft has a metallic firewall it can be used as a shield to block the majority of RF noise. To be most effective any wire that passes through the firewall should be fitted with a Ferrite Bead (also known as a Suppressor or RF Suppressor). Bundles of wires can have a single large Suppressor fitted rather than a Suppressor for each wire. The wiring diagram in Figure 26 shows suppressors in schematic form. These suppressors are readily available at local electronics stores.
- A Noise Filter can be fitted to the radio's power supply. Again, these filters are readily available from local electronics stores. The manufacturer's instructions must be followed for installation.
- Cables passing through the firewall (such as throttle cables, choke, carburettor heat and cabin heat cables) can transmit RF noise back into the cabin. This can be minimised by earthing the cables at ONE end. On the Jabiru Engine an earth wire (Shown in Figure 27) is provided connecting the carburettor to the rest of the engine, so the throttle and choke cables are connected to earth through this wire.
- It is normal & unavoidable that the engine's ignition system produces some RF noise. This can be minimised by:
 - i. Ensuring all spark plug gaps are set properly.
 - ii. Ensure ignition coil gaps are set properly
 - iii. Ensure all high-tension leads (Spark plug leads) are firmly fitted at both ends to the spark plug and to the distributor. In addition, the lead from each ignition coil to the distributor must be firmly fitted to the distributor.
 - iv. Ensure Distributor caps and rotors are in good condition.
- To counteract RF noise, Jabiru Aircraft run shielded wiring on all radio and intercom wiring. In our experience, the "Earth Return" method of shielding (where the shield for the wire is also used to form the earth connection) does not work as well as the "Faraday Cage" (where the shield is a shield only it is not a part of the circuit) method of shielding
- "Earth Loops" where a wire is connected to earth at both ends can introduce RF noise into the system. All shields should be connected to the aircraft's earth system at one end only.
- The cable used for the Antenna should be high quality, such as RG400 (Shown in Figure 25). This cable has a double layer of shielding and better RF insulation than other cable types. Note that the coaxial cable included in most antenna kits tends to have a single layer of insulation. BNC connectors are recommended for most applications, and wherever possible crimped connectors which require a special crimper to assemble should be used. Crimped connectors are much less prone to RF leakage or assembly issues than other types (such as screw-together BNC connectors).
- Wires and antenna cables must be routed carefully. Bending or coiling Co-axial cable (such as is used for antennas) sharply will significantly degrade the cable's RF shielding and must be avoided wherever possible. Coiling antenna cables or any wire carrying current (sensor wires carry very low current so are generally exempt from this requirement) into loops can induce RF noise in other systems. GPS antennas in particular are powered both the antenna and any excess antenna cable must be positioned carefully, as far away from the radios, antennas and intercom as possible.
- While not a part of the engine installation, strobes can produce significant RF noise. Most brands of strobes require that the box containing the strobe head unit electronics is earthed, and this is essential to minimise noise. The cables used for the strobe lights themselves must be shielded and the shield must be earthed properly, at ONE end only. The Box containing the strobe electronics can also be installed on the engine side of the firewall to further reduce RF noise. The strobe unit's manufacturer normally provides good instructions for minimising their effect on radio noises.

Installation Manual

Jabiru 3300 Aircraft Engine

5 Fuel Supply System

5.1 Fuel Tank

- The fuel tank must be fitted with an outlet strainer of between 8 and 16 mesh per inch, with a minimum total mesh area of 5 cm².
- Ensure the fuel tank is properly vented.

5.2 Fuel Filtration

- A Fuel filter capable of preventing the passage of particles larger than 0.1mm (100um) must be installed between the fuel tank outlet and the fuel pump.
- The filter must be present in the system for the fuel flow test. The size of the filter should give consideration to allow adequate flow with a used filter.
- A Ryco Z15 disposable paper element automotive filter has been used successfully. Note that this filter, or any other filter with a plastic body must not be used on the engine side of the firewall – regulations and common sense both require that all fittings in the fuel system on the engine side of the firewall must be fire resistant.

5.3 Mechanical Fuel Pump

- The mechanical fuel pump is mounted on the engine crankcase and is camshaft driven. It is designed to supply fuel at the pressure described in the following paragraph.
- Many airworthiness categories require that a backup fuel pump be fitted in case the primary pump fails.
 Jabiru Aircraft recommend fitting an electrical boost pump. If fitted, this pump must also fulfil the fuel input criteria for the carburettor, given below.
- Some airworthiness categories also require an additional drip tray be fitted to the fuel pump. This optional tray is shown in Figure 28.

Figure 28. Mechanical Fuel Pump

5.4 Fuel Flow Meters

Where a Fuel Flow Meter is to be installed to the aircraft Jabiru Aircraft recommend that the flow transducer
is not installed on the engine side of the firewall. Most transducers are made of either plastic or light
aluminium and are not fire resistant. Regulations and common sense both require that every part of the fuel
system on the engine side of the firewall must be fire resistant.

5.5 Carburettor

 A Bing constant depression type 94/40 is used. This carburettor has a minimum delivery pressure of 5 kPa (0.75 Psi) and a maximum pressure of 20 kPa (3 psi). To confirm that the fuel system is capable of delivering this pressure a fuel flow test must be performed.

REVISION	0	1	2	3	4	5	6	7		Dated: 1 st Dec 2016	Page: 27 of 56	
----------	---	---	---	---	---	---	---	---	--	---------------------------------	----------------	--

Installation Manual

Jabiru 3300 Aircraft Engine

WARNING

When using auto fuels, the fuel delivery system must be designed to prevent fuel vaporization.

To check pressure, insert a 'T' piece between the mechanical pump & carburettor. Test boost pump with engine off, then mechanical fuel pump with engine on, then combine with electrical boost pump as well, before first flight.

- A method for performing a fuel flow test is available from Jabiru if required. In brief, the fuel line is
 disconnected from the carburettor, fuel is pumped into a calibrated container and the rate at which the fuel is
 pumped (or drained, for gravity-fed systems without a pump) is calculated.
- Most regulations require that the fuel system (including pumps) supplying the engine be capable of delivering 1.25 to 1.5 times the maximum flow rate required for the engine. For a Jabiru 3300 engine this equates to approximately 44 to 53 Litres per hour (see Section 1.5.3). The electric boost pump used on Jabiru Aircraft generally manages a flow rate of approximately 60 litres per hour.
- The Bing carburettor has a Balance tube (also known as a "sense tube") which connects the carburettor to the air box. The tube runs from a nipple on the carburettor to the airspace in the air box on the "clean" side of the air filter. This tube is part of a system or ports which "tells" the carburettor how hard the engine is working and controls how the carburettor varies the fuel / air mixture delivered to the engine. Tuning issues and poor running will result if this tube is blocked or connected to the wrong spot. Figure 30 shows the tube installation. Note that the balance tube must not be connected to the air box in a location where the air is moving fast rapid flows produces pressure changes and boundary layer effects which mean the balance tube gives the carburettor "bad" information, which can cause poor mixture control and running issues.
- A drip deflector to deflect overflowing fuel from the exhaust system is supplied as standard equipment on the engine.
- Because idle adjustments cannot accurately be made on the dynamometer (where every engine is run before delivery), some adjustment of the 7mm idle set screw may be required. A hot idle of around 900RPM is desirable.
- Fitting an earth strap from carby to crankcase is recommended to eliminate possible radio interference.

Figure 29. Carburettor Installation

Installation Manual

Jabiru 3300 Aircraft Engine

- The Bing altitude compensating carburettor uses bowl float level and two main air circuits the idle and the needle/main to control the mixture. Both circuits use jets to meter the rate at which fuel is allowed to flow. The jets are small brass parts with precisely controlled openings (both the size of the opening and the shape surrounding the opening affect fuel flow rate) which can be changed to adjust engine mixture.
- The main and idle jets have simple fixed apertures, while the effective size of the needle jet aperture varies, depending on the diameter of the needle. Figure 32 below shows three different throttle settings in the needle jet and the corresponding difference in aperture. On the left is a low power setting, where the needle jet is nearly completely blocked by the needle. The middle throttle setting corresponds approximately to a high cruise power setting. The gap between the needle and the sides of the jet is much larger. The final setting corresponds approximately to wide open throttle. The needle jet is now effectively not there, and the amount of fuel flowing is controlled by the main jet (located upstream of the needle jet in this circuit).
- The shape of the taper of the needle controls the mixture at a given throttle setting. The needle used in Jabiru engines been optimized for use with a propeller, which puts a very non-linear load on the engine; to double the RPM of a propeller a lot more than double the power has to be applied.
- To achieve a good mixture with the type of load applied by a propeller, the Jabiru needle uses two-stage taper and a straight tip. The more gradual taper at the upper end of the needle gives a leaner mixture in low-power cruise settings and at lower RPM where the propeller is using relatively little power. The sharper taper at the lower end ramps up rapidly to a much richer mixture at higher power settings. The straight tip of the needle is used when the throttle is wide open and the engine's mixture is being controlled by the main jet. This rich mixture at full power protects the engine from detonation.
- The transition from lean, cruise mixtures to richer full-power mixture will occur at around 2800 3000 rpm on 4 and 6 cylinder engines, when fitted with an appropriate propeller. For most efficient operation, the transition must be above cruise rpm. The transition can clearly be seen by changes in the EGT.

Figure 32. Needle Jet (Jabiru Needle)

- Because of the way the carburettor uses the sense ports and balance tube to regulate the mixture it is sensitive to the way the intake air moves, and to the conditions of the intake system.
- Section 6 below contains information on setting up the induction system.

REVISION	0	1	2	3	4	5	6	7		Dated: 1 st Dec 2016	Page: 30 of 56
----------	---	---	---	---	---	---	---	---	--	---------------------------------	----------------

Installation Manual

Jabiru 3300 Aircraft Engine

5.5.2 Carburettor Tuning

- The mixture supplied to the engine by the carburettor is affected by a large number of variables, including:
 - i. Ambient temperature
 - ii. Propeller size (coarse or fine) and loading
 - iii. Whether the engine is cowled or open (by affecting the temperature of the induction pipes and carburettor)
 - iv. The airframe type
 - v. The intake system
- Because of these factors, we recommend that whenever a new engine installation is being developed that the engine be fitted with EGT probes and the tuning checked.
- Jabiru Aircraft or our local representative can provide assistance during this phase.

5.6 Fuel Lines

- Fuel lines are nominally 6mm bore.
- All hoses forward of the firewall require fire resistant sheathing (visible as an orange covering on the fuel lines in Figure 28 above). Note that wherever possible the sheathing should be extended past the hose clamp. The ends of the sheath must be held in place using safety wire to prevent the sheathing moving and exposing the fuel line.
- Fuel lines between moving sections such as between engine and firewall should be flexible. SAE standard automotive rubber hoses are adequate, provided they are protected with fire resistance sheathing.
- In many countries (including Australia) standard airworthiness requirements state that all flexible hoses must be changed every two years, though if there are visible signs of degradation (such as cracking or hardening) the hose should be changed immediately.

Jabiru Aircraft Pty Ltd	MARIE
Installation Manual	Jabiru 3300 Aircraft Engine

6 Air Intake System

6.1 Intake Air Heating

• The Jabiru 3300 engine can experience carburettor icing in some conditions. Jabiru Aircraft strongly recommend that a system for heating engine intake air be included in the induction system design.

6.2 Intake Hose & Air Filter Box

- Jabiru Aircraft recommend that engine intake air be drawn from outside the cowl wherever possible.
- Due to the way the carburettor works (as described above) it is sensitive to the air flowing into it. Turbulence, swirl and sharp edges all affect the mixture metering system of the carburettor.
- The hose type recommended for induction systems is SCAT aircraft type.

WARNING

SKEET type, which has an inner liner must NOT be used. Over time the inner lining can detach and collapse, blocking the hose. SKEET hose should be used for positive pressure applications only.

- Tight corners in the hose (as shown in Figure 33) can introduce both swirl and turbulence to the air flowing into the carburettor
- Connecting the hose directly to the carburettor can cause the hose to bunch up and cover the sense ports. A "Cobra Head" duct or similar is recommended to prevent this.
- Sharp corners inside the air filter box cause turbulence and a pressure drop. The pressure drop means that
 the carburettor balance tube pressure reading is inaccurate, while the turbulence affects the readings at the
 carburettor sense ports. Both items can cause power loss and rough running particularly at high power
 settings.
- For installations where there is very little room between the carburettor and the firewall a special duct has been developed to minimise pressure drop and turbulence shown in Figure 37.
- The intake hose should align as closely as possible with the carburettor body having the intake duct come at the carburettor from one side encourages swirl and can give uneven mixture.

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 37. Cobra Head for Installations with Minimum Carburettor Clearance

6.3 Air Filter

- The induction system must not cause positive RAM induction pressure as this will have an unpredictable affect the fuel/air mixture supplied to the engine.
- The filter must be capable of supplying 250 kg/hr (550 pph) of air
- The filter may have to be changed at regular intervals if the engine is to be used in a dusty environment.
- Air flow should be as direct as possible, no tight bends and air taken from outside the cowl. Current air filter is RAF 17 (Repco)

6.4 Ram Air Bleed

- The hot air mixer box / filter boxes manufactured by Jabiru Aircraft have a Ram Air Bleed flap incorporated.
- This flap prevents excess ram air pressure in the induction system.
- If the engine ever backfires, the flap also acts as a relief valve to let the excess pressure escape without damaging the induction system.

Figure 38. Ram Air Bleed

Installation Manual

Jabiru 3300 Aircraft Engine

7 Exhaust System

- An exhaust system is provided with the engine. Both Pusher and Tractor systems are available.
- Muffler Volume Capacity 5 litres
- Back pressure at Takeoff Performance Max 0.2 bar (2.9 psi). Readings taken 70mm from muffler flange connections. Only complete mufflers supplied with Jabiru Aircraft are welded all others require tail pipes to be TIG welded to the muffler body. NOTE: Drilled ends of pipes go inside muffler cavity. The tail pipes go completely through the muffler body and are welded on both top and bottom.
- When fitting the muffler one or more of the exhaust pipes can be loosened at the connection to the cylinder head to allow easy fit of the muffler. They then must be tightened.
- Exhaust Gas Temperature (EGT) limits are given in Section 1.5.7.

8 Propeller & Spinner

- The hub of the propeller must be drilled with holes to match the flange.
- Fixed pitch wooden propellers are preferred. To safely use a propeller made of metal or composite a crankshaft vibration resonance survey has to be conducted to ensure that there are no damaging vibrations. Note that this refers to each new propeller design using composite or metal blades once proven the propellers do not need to be tested for each individual installation. However, due to their inherent vibration damping qualities, wooden propellers can be used without this testing.
- Jabiru Aircraft now has a composite scimitar propeller which is the standard installation for new LSA and kit aircraft. A vibration survey was conducted on this propeller design and the characteristics are known when installed with a Jabiru engine within the range of typical pitch setting angles specified.
- Wooden propellers require periodic inspections to maintain proper attachment bolt tension Typically every
 50 or 100 hours, depending on the propeller manufacturer's recommendations.
- Belleville washers may be used as shown in Figure 39 to allow for expansion and contraction of Jabiru wooden propellers.
- The propeller must be carefully selected to match the airframe and the engine: Propellers up to 1778mm (70") in diameter and between 762mm (30") and 1397mm (55") in pitch² may be used. The propeller flange is drilled with two sets of holes which can be used for propeller mounting. 6 holes at both 101.6mm (4") PCD and 111.12mm (4 3/8") PCD (total of 12 holes).
- The Jabiru Engine does not have a hydraulic pressure supply or a governor mounting pad required for a hydraulic constant speed or variable propeller.
- Propellers with excess pitch can cause high temperatures and engine damage. Nominally, all propellers
 must be able to obtain 2800rpm static and 3150rpm to 3300rpm wide open throttle straight and level.
 However, in some particularly low-drag airframes it may be necessary to use a propeller which does not
 achieve 2800 static rpm. In these cases propellers should be chosen based on their RPM at wide open
 throttle (straight and level flight).
- Do not cruise or climb in the range 2100rpm 2400rpm.
- Maximum moment of inertia 0.3 kgm²
- Applications outside this range should be referred to Jabiru.

WARNING

Engine MUST NEVER BE RUN WITHOUT THE PROPELLER. Damage will occur in this state.

² Pitch measurements are taken from the angle of the rear face of the prop blade. Other propeller manufacturers may specify pitch measured from the blade mean chord line or other reference. Make sure you are comparing equivalent pitch units when specifying a propeller.

Jabiru 3300 Aircraft Engine

9 Engine Installation Procedure

- Attach male engine mount rubbers to all engine mount pins on the engine mount. Place an AN4-31A bolt through each mount. Note that an engine mount spacer washer is fitted between the male rubber & the lower engine mount pins (Refer to Figure 42 below).
- With the Back of the Aircraft Supported & the wheels chocked, lift the engine onto the engine mount.
- Insert the upper engine mount rubbers into the engine backing plate first by tilting the front of the engine up. Once both upper rubbers are through the engine backing plate, fit the female rubber, engine mount spacer washer, engine mount washer, ½" washer & Heat Proof nut.
- To place the nuts on the mount bolts the rubbers must be compressed. Do this by using a deep reach socket inside the engine mount pins & clamping the rubber mount assembly using a G-clamp with the swivel taken off the ball. See Figure 41. Start nuts on both upper mount bolts.
- Once bolts of the upper rubbers are started, continue lowering the front of the engine & align the lower
 engine mount pins with the engine backing plate.
- Use the weight of the engine to compress the lower rubbers & fit the nuts to the bolts.
- The lower engine mount rubbers are assembled in the same way, except the male engine mount rubber is fitted to the engine mount pins first. Refer to Figure 42 below.
- Tighten nuts until firm. (Engine mount washer will touch the engine mount pin as the rubbers compress)
- Connect the fuel line to fuel pump (Refer to Figure 41). Ensure the fireproof sleeve is in place.
- Ensure the fuel line from fuel pump to the carburettor is connected & protected by fireproof sleeve.
- Ensure that the fuel overflow line is in place, and secured to vent overboard. This is the small, clear hose shown leading from the fuel pump in Figure 41.
- Fit the oil over flow bottle to the firewall by drilling and Riveting oil bottle holder in place using 73AS 6-6 rivets. Refer to Figure 8.
- Connect the oil breather line from the engine breather.
- Ensure that the oil overflow line is in place and vents overboard.
- Fit Scat hoses from NACA duct to Air Inlet Housing Assembly, from hot air muff to carburettor heat inlet on the hot air mixer box and from the hot air mixer box to carburettor shown in Figure 44.
- Fit throttle cable to carburettor. Note that Jabiru Aircraft kits come with a throttle cable cut to length and with the correct end fitting attached. Engines used in firewall-forward kits will be supplied with a length of throttle cable with no end the builder must cut the cable to length and fit the carburettor end fitting. 5/16" washers are used on the cable end fitting (one washer either side of cable end fitting) to align cable. Use R-clip to assemble. Figure 46 refers.
- Fit choke cable to carburettor. Use an R-clip to assemble. Note that the fuel line from the fuel pump to the carburettor passes between the choke and throttle cables. The choke is shown in Figure 7.
- Connect the fuel balance tube from the nipple on the carburettor to a fitting on the filtered air side of the air mixer box.
- Fit cylinder head temperature (CHT) sensor. The CHT sensor used in Jabiru aircraft is a J-type thermocouple. The VDO 310 980 Cylinder Head Temperature Gauge Kit is compatible with this sensor and is installed as standard equipment in Jabiru Aircraft. Note that to ensure an accurate temperature reading it is important to have the cold junction for the CHT (the plug between the stiff thermocouple wires and the normal, plastic-insulated gauge wires) located away from the heat of the engine. Refer to Figure 22.
- The Oil Temperature Sensor used is a VDO 320 028 which is located in the bottom of the sump as shown in Figure 17.
- The oil pressure sensor is located at the base of the oil filter and this can be seen in Figure 19. The sensor
 used is VDO 360 001.
- The exhaust gas probe used on Jabiru engines is a VDO 310 306 Pyrometer which is supplied as a complete kit. The probe is mounted in a fitting which is welded to an exhaust pipe. **Note that this fitting is not standard**. The installation of the fitting is best done at the time of order, though if required the exhaust pipe may be returned to Jabiru and the fitting added. Note that in this case it will normally take around 2 weeks before the pipe is returned to you. The fitting is welded to the pipe 120mm down from the exhaust manifold mounting plate.

Jabiru 3300 Aircraft Engine

10 Before First Start

- Expel inhibiting oil from cylinders and pressure up (wind engine on starter until a the oil pressure gauge shows a reading) before first start.
- Ensure correct run-in type oil is used for the first 25 30 hours to ensure proper ring bedding-in.
- Once past the initial 25-30 hours, ensure the oil used meets the specifications given above.
- Oil coolers are mandatory unless operating in very cold ambient temperatures. Refer to Oil Cooling section above for allowable oil operating temperature ranges.
- Do not overfill the engine this may result in high oil temperatures.
- Check for contact of engine, cooler or ducts on cowl. Any contact will cause excessive vibration & if the oil cooler is rubbing it will eventually fail & leak.

11 Auxiliary Units

11.1 Vacuum Pump

- For the installation of an artificial horizon and/or a direction gyro a vacuum pump is necessary. A Tempest 212CW (or equivalent) vacuum pump can be fitted to the alternator mounting plate and directly coupled to the crankshaft. The drive pad is dry.
- The pad and spline are SAE Standard.
- For later engines (S/No. 1522 and onwards) the vacuum pump drive spline is an option extra not included with the standard engine it must be ordered separately.

Installation Manual

Jabiru 3300 Aircraft Engine

12 Cooling Systems

12.1 General Principles

- An ideal cooling system:
 - i. Controls engine temperatures through speeds ranging from taxiing on the ground through to V_{NE}.
 - ii. Controls the engine temperatures through a wide range of angles of attack.
 - iii. Is simple to build, install and maintain
 - iv. Produces minimum drag
 - v. Requires no pilot attention
 - vi. Is not affected by rain, dirt or insects sticking to it.
 - vii. And weighs next to nothing
- For the sake of the following discussion, a "gap" is considered an opening roughly large enough to slide two fingers into around 13mm by 32mm (0.5" by 1 1/4").
- The total area of the air intakes (combined cylinder head and oil cooling openings) should generally be no more than one third the total area of the cowl outlet (the outlet area must be a minimum of about 3 times as large as the total area of the inlets). This assumes that the outlet area is oriented effectively (see Figure 58).
- Each cowl cylinder head Inlet of a Jabiru Aircraft has an area of approximately 10,500mm² (16.25 in²). Oil cooler inlets have an area of approximately 12,500mm² (19.4 in²). This gives a required total outlet area of approximately 100,500mm² (155 in²). These sizes are based on a Jabiru Aircraft. Inlet and outlet sizes required will vary depending on the aircraft's speed, drag and the positions of the inlets and outlets the areas given should be used as a guide and starting point only.
- A generalised picture of the airflow and air temperature is shown in Figure 47.
- Most of the time, air leaking through gaps instead of flowing though a cylinder head, oil cooler or similar is
 waste air it does not transfer heat and does not cool the engine. Sometimes air leaking through controlled
 gaps such as the holes in the front of the ram air ducts (Figure 50) or the gaps between cylinders can
 have beneficial effects. However, it is recommended that gaps around the engine and oil cooler be closed
 as a starting point.
- The propeller & rush of air from the aircraft's speed make it easier to get air into the cowl than to get it out.
- Too much air flowing through the oil cooler can restrict airflow through the cylinder heads, & vice versa.
- The pressure difference between the low pressure outlet area of the cowls and the high pressure inlet areas controls the amount of air flowing through the engine. The pressure differential testing described in Section 12.5 gives target pressures.
- During developmental work it is strongly recommended that each cylinder head has it's own temperature sensor. Modifications to cowls etc can have unpredictable effects and normally a change will affect each cylinder head differently i.e. head #4 may cool down while head #3 heats up.
- Testing of an installation in a Jabiru Aircraft showed that the heat radiating from the engine exhaust system
 normally has a minimal effect. Wrapping the exhaust in insulation etc does not produce a measurable
 temperature reduction during taxi or in the air.

WARNING

The limits in the Specification Sheet, contained in Appendix B, must be strictly adhered to. Warranty will not be paid on engine damage attributed to overheating of cylinders or oil.

Figure 48. Cowl Airflow (Black & White Version)

Installation Manual

Jabiru 3300 Aircraft Engine

12.2 Flow Visualisation

- In designing the cooling system the designer must have a basic understanding of how air flows and behaves inside the cowl. The pictures below are intended to explain it in simple terms.
- Figure 49 shows two schoolrooms, drawn as if seen from above. Each room represents an engine and oil cooler inside a cowling.
 - i. There are two doors in the inlet side of the room and one on the outlet side.
 - ii. Several desks are placed in the room, representing the engine cylinders and the oil cooler.
 - iii. Students walk through from left to right, representing the air flow through the cowls.
 - iv. On each desk is a pile of homework papers, representing heat generated by the engine.
- Air always takes the path of least resistance. It tries to escape quickly to the playground without taking the homework.
- The desks and doorways form restrictions. If the desks are too close, not enough students can pass through. If the desks are too far apart some students will not pick up their homework. If the inlet doorways are too large then there will be a traffic jam trying to get out of the outlet door.
- Gaps can leave room for students to pass without picking up homework.
- Given a group of desks as shown, students can follow many paths through them from front to rear, from top to bottom or any combination.
- Slowing down the students as they pass through the desks means they will pick up their homework, but if they are slowed down anywhere else it only reduces the amount of students that can get through the room.
- If the exit becomes jammed with people, installing bigger inlet doors will not increase the number of students passing through the room. Exits should be as clear and free of obstructions as possible to let people out.
- Students will often have a preferred desk to take their homework from, meaning that some cylinder heads will have more heat removed than others temperatures will wary between different heads.

- Partitions are used to force the students to walk through the desks.
- Each student picks up the homework.
- Outlet door is 90° to the flow of students in the corridor; there is no restriction & jostling at the exit
- No partitions are used, so students walk around the desks instead of through them.
- Most students don't come close enough to a desk to pick up the homework
- Outlet door is parallel to the flow of students in the corridor, causing restriction & jostling at the exit

Figure 49. Flow Visualisation

----------	-----	---	-----	---	---	---	---------------------------------	----------------

Installation Manual

Jabiru 3300 Aircraft Engine

12.3 Air Inlet & Ram Air Ducts

- The engine should be installed using RAM AIR ducts provided with the engine. The ducts themselves are to be assembled as detailed in Section 12.3.1.
- The ram air ducts are screwed to the engine using the normal rocker cover screws. Note that if the duct is not fastened to the engine then air pressure at high speed can lift the ducts off the engine. This will upset the pressure balance inside the cowl and impede cooling. More importantly, with some types of ducts, the duct lifting will dislodge the spark plug high tension leads, causing the engine to run roughly or stop.
- For best cooling on the ground, during climb and low speed flight the propeller used must have significant
 pitch and blade area on the section immediately in front of the air inlets. At low speeds the airflow does not
 have much energy, and the acceleration and pressure provided by the propeller greatly assists in getting air
 into the ram air ducts.
- Each duct must have a 25mm hole at the inside top front to bleed air over the crankcase.
- The pressure differential between the inside the cooling ducts and the cowl outlet must not be lower than 60mm (2.4") water gauge at when the aircraft's speed is 1.3 times the stall speed (1.3 x V_s).
- The cooling ducts provided are a starting point in establishing effective engine cooling. The ducts may require to be increased in size and additional baffles provided for best cooling.
- Tubes of approximately 12mm diameter are required to provide cooling air to the ignition coils Figure 51.
- For an air cooled engine it is entirely normal for there to be significant differences in the temperature of each cylinder head. Often the head which is hottest in the climb will not be the hottest during cruise & descent. This is only a problem if the hotter heads exceed the engine's set limits.
- "Gull Wing" baffles can be used to fine-tune the restriction to airflow caused by the engine, and this in turn affects the volume of air flowing through the engine and into the cowls. Fitting the baffles will give a higher restriction as it forces air to flow through the small gaps between fins. Leaving the baffles out provides larger gaps and a higher volume of relatively cool air blows through these gaps into the "Hot" zone immediately under the cylinder heads. Wherever possible it is recommended to leave the baffles out. However, compared to an installation with the Gull Wings fitted, a significantly larger volume of air must be sucked out of the cowl outlet. This often requires a larger cowl outlet or a larger lip on the existing outlet. Pressure differentials must be maintained.
- Check for contact of engine, cooler or ducts on cowl. Any contact will cause excessive vibration & if the oil
 cooler is rubbing it will eventually fail & leak.

Front baffle in duct to prevent air slipping under cylinder & head

Rear baffle to direct air into rear cylinder head

Hole in ram air duct to blow cool air over the crankcase

Figure 50. Front-On View Into Ram Air Duct

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 51. Coil Cooling Detail

12.3.1 Ram Air Duct Assembly & Installation

As supplied, the seam at the front of the ram air duct is not joined. This joint must be bonded using 5-minute epoxy & flock. Use a length of masking tape on the join line at the bottom of each duct inlet to hold the join firm and prevent Epoxy/flock from leaking through.

Figure 52. Ram Air Duct Front Seam

- Before installation the front air dams need to be cut to size. Take the length of glass fibre sheet with the
 curved edge, hold it against the rear of the duct inlet with the curve towards the top rear of the duct and mark
 around the bottom of the duct then cut to shape. Figure 53 refers.
- Tape the air dam into place. Mix a small batch of 5-minute Epoxy and flock and use it to fix the air dam into place. Leave to cure, then sand away any rough edges.
- Remove the masking tape and roughen the underside of the duct and the back of the air dam.
- Mix a small batch of epoxy resin (structural resin not 5-minute epoxy) and brush 2 layers of AF303 glass fibre cloth to the underside of each duct, covering the join line and wrapping up around the back edge of the air dam. Leave overnight to cure.
- The completed baffle is shown in Figure 50.

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 53. Air Dam Installation

12.4 Oil Cooling

- The dipstick cap must be screwed fully in before removal for reading oil level.
- An oil cooler adapter is supplied with the engine & fits under the oil filter. The cooler can be plumbed either way to the adaptor flow direction is not important. Oil coolers are available from Jabiru Aircraft.
- Unless consistently operating in low temperatures, oil coolers are mandatory. Note: if you fly in cold weather and don't have an oil cooler you can't fly if it warms up. You can always block the oil air off in cold conditions.
- In continuous operation oil temperatures between 80°C and 90°C (176°F 194°F) are desirable. 70°C (158°F) is the minimum allowable temperature for continuous running and 100°C (212°F) is the maximum allowable temperature for continuous running.
- Over filling with oil is not desirable. It can cause elevated temperatures & excessive oil use & loss.
- Hoses should be nominally 10mm (3/8") bore.
- Hoses must be changed every 2 years or if visible degradation (cracking, hardening) is visible at inspection.
- A pressure drop of at least 60mm (2.4") water pressure between the air flowing into the cooler and the air flowing out of the cowls should provide sufficient oil cooling if using a standard Jabiru oil cooler.
- Section 12.1 noted that air leaking through gaps in the cooling system ducts is generally waste air, not contributing to cooling though it noted that there were exceptions to this rule. Oil cooling is the feature of engine installations that is most often improved by "leaks" like this. A controlled amount of free air blowing over the sump, crankcase and underside of the engine can significantly improve oil temperatures (Figure 54 shows a duct of this type fitted to a Jabiru 6-cylinder engine). However, for this to work the cowl installation must be able to cope with the extra volume of air flowing into the cowl space the outlet area or outlet lip size may need to be increased to suck out the extra volume.
- Figure 55 shows an oil cooler installation of a Jabiru 3300. Note Detail C in the lower corner of the drawing, which shows the cooler being fitted using rubber mounts. This is very important as it insulates the cooler from engine vibrations coolers installed with a soft mount like this are much less likely to fail in service.

Note: If oil cooler hoses are installed with oil on the hose fittings or, with oil on the inside of the hose in the vicinity of the fittings, hose security may be adversely affected.

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 54. Oil Cooler Duct Design

Figure 55. Oil Cooler Installation

12.5 Air Outlet

- As the sections above describe, getting air out of the cowling is often the factor limiting how much air can be
 pushed through the engine and how well it is cooled.
- The shape of the outlet of the cowls controls how effectively air is sucked out of the cowling and is arguably the single most important aspect of cowling design.
- As noted above, as a rule of thumb the cowl outlet area should be at least 3 times the combined area of all the cowl inlets.
- Figure 56 shows a small lip added to the rear of the cowls of a Jabiru Aircraft. This lip gives a large improvement to pressure differentials and engine cooling.

REVISION	0	1	2	3	4	5	6	7		Dated: 1 st Dec 2016	Page: 49 of 56	
----------	---	---	---	---	---	---	---	---	--	---------------------------------	----------------	--

Installation Manual

- Figure 57 shows an aircraft at varied angles of attack to the surrounding air. The cowl inlets and outlets must both be designed to work effectively at all angles which the aircraft will normally experience.
- Figure 58 shows two different cowl outlets one is basically an opening in the flat bottom of the cowl, while for the other the opening is oriented at 90° to the airflow direction. Vertical orientations (Deep Outlet) give better pressure differentials and are less affected by aircraft angle of attack than horizontal (Long Outlet).
- Figure 58 also shows the lower firewall section of a Jabiru Aircraft. The lower part of the fuselage has two
 large ramps moulded in which increase the depth and area of the cowl outlet (and also provides mounting
 points for the rudder pedals). This type of feature is not mandatory for good engine cooling but it does help.
 An alternative is to make the bottom corner of the firewall as smooth and rounded as possible to help airflow
 and minimise the outlet restriction.
- Some aircraft types have a flange running around the firewall. Particularly on metal types, this flange is a useful way of mounting the cowls. However, if the flange runs across the edge of the firewall where the cowl outlet is located then it causes a significant flow restriction. Figure 59 shows a drawing of the lower section of a firewall with a flange of this type. Wherever possible flanges across the cowl outlet should be avoided. Alternatively a fairing can be built inside the cowl to smooth airflow over the lip & reduce flow restriction.

Figure 56: Lip to aid cooling as installed on a Jabiru.

Installation Manual

Jabiru 3300 Aircraft Engine

Figure 58. Cowl Outlet Geometry

Figure 59. Outlet Restriction Caused By Flange On Lower Firewall

12.6 Cooling System Testing & Evaluation

- For new installations (new designs rather than new aircraft of a known type) the pressure drop across both Ram air ducts must be checked.
- The following is a guide to evaluating an engine installation to see if it meets minimum cooling requirements.
- The easiest way to measure the air pressure drop across the engine and oil cooler is using a U tube
 manometer using water. It is basically a piece of clear tube bent into a "U" and half filled with water (if the
 water is hard to see add a bit of food colouring).
- For ram-air duct pressure, connect one side of U to a static port inside the ram air duct and the other to a static probe inside the cowl near the outlet. For the pressure drop across the oil cooler plumb a static probe against the front of the cooler and a static probe inside the cowl near the outlet. The further the probe is in front of the cooler the less the static pressure that will be measured, so place the probe no more than 5mm in front of the cooler and parallel to it.
- Using multiple U-tubes several measurements can be taken in one flight.
- Details of a typical static probe are shown in Figure 60.
- Note that probes must be fitted in the same place each time to ensure you get consistent measurements.

Some hints.

- Usually the most critical situation for cooling is climb however this is not always true, so check all situations.
- The change in air temperature is approximately the same as the change in engine temp. For example if you did all your testing in 15°C and you want to flying in up to 35°C weather, in 35°C all your engine temps will be approximately 20°C higher. Check you have sufficient margin for all conditions you plan to fly in.

Installation Manual

Jabiru 3300 Aircraft Engine

- If the engine gets too hot during testing don't push it. Something needs to be changed.
- For low speed cooling a lip on the front edge cowl outlet can add up to 20mm of pressure drop at 65kts (a lip 25mm deep at 60° to the airflow shown in Figure 56).
- Refer to Figure 22. CHT terminals must be placed correctly or inaccurate (too high) readings can result.

Figure 60: Cooling pressure measurement.

Figure 61: Ram Air duct pressure tapping.

12.7 Pusher Installations

- For pusher installations the details given above hold, though some changes are necessary for the different configuration.
- Versions of Jabiru ram air ducts are available for high speed and low speed pusher installations.
- The propeller can be used to suck air out of the cowls, using the following as a guide:

Installation Manual

Jabiru 3300 Aircraft Engine

- i. Wherever possible the cowl outlets should be vertical openings with lips that come close to the propeller as close a possible without the blades hitting the cowls.
- ii. The propeller blade must have significant pitch and chord in the section which passes over the outlets.
- iii. The cowl openings should each be reasonably small. As each blade passes the opening it will create a suction in the cowl behind it, but if the cowl opening is large this effect will be dissipated. Alternatively, larger openings can be divided up by fitting louvers or vanes.
- Augmentor type exhausts (Figure 62) can also be used to suck air out of the cowlings.
- In pusher installations the inlets into the cowl are harder to get right than in a tractor installation. Intake ducts should be as straight as possible with no sharp corners or other restrictions to the flow.
- The position of the cowl air inlets is critical inlets on the upper surface of the aircraft are generally in low pressure zones while those on the underside are normally in high pressure zones. Depending where the inlet is located, the area ratio between inlet and outlets may need to be modified.

12.8 Amphibian or Seaplane Installations

- Water taxiing requires relatively high power settings for long periods and this is often the most critical condition for cooling systems in these aircraft.
- Increased duct size (scooping more air through the engine) may be necessary.
- For amphibian or seaplane aircraft using a pusher engine installation the methods outlined above can use the propeller to suck air out of the cowls, but ultimately the effect is limited and can conflict with cooling requirements in other modes of flight. For these installations some form of active venting for the cowls such as flaps, fans or an augmentor-type exhaust system (See Figure 62) may be required.

Figure 62. Augmentor Exhaust System

12.9 Slow Speed Installations

- Installations where the cruise speed is below around 70 80 knots are considered slow speed installations.
- Jabiru ram air ducts are available for slow speed installations. These are larger than the ducts used for faster aircraft.
- Increased duct size (scooping more air through the engine) may be necessary for slow speed installations.
- Increased outlet size and more aggressive outlet lips may be required.
- In some of these installations where the airframe has a lot of drag it is preferable to do away with cowls altogether and run an open installation. Aircraft such as the Thruster (Vision), Drifter, X-Air and some RANS models are examples of this. In these cases large ram air ducts are used, and the rest of the engine is exposed to the propeller wash for cooling.

Jabiru 3300 Aircraft Engine

14 Appendix B – Jabiru Aircraft Installation

- The following information describes the installation and performance of a Jabiru SP Aircraft fitted with the 3300 engine.
- The information given can be used to estimate the performance of different designs, though obviously there will be differences depending on how similar the aircraft is to the Jabiru described below.
- Poor installations will result in poor performance, so installations must be designed referencing the information given in the main body of this manual.

14.1 Known Airframe / Engine Details

- Jabiru SP (2 Seater)
- Propeller 60" x 53" (1525mm x 1346mm) or
- 60" x 48" (1525mm x 1219mm)

14.2 Normal Operation Data

•	
• The following are typical values for the engine	when installed in a Jabiru SP:
Idle Hot:	. 900 – 950 RPM
Take Off Power:	. 2800 RPM (60" x 53" Propeller)
	. 2900 RPM (60" x 48" Propeller)
Full Power S&L:	. 3200 RPM (60" x 53" Propeller)
	. 3300 RPM (60" x 48" Propeller)
Cruise At 75% Power:	. 2750 - 2850 RPM
Oil Pressure:	. 300 kPa (44 psi)
Oil Temperature Cruise:	. 80°C (175 °F)
Oil Temperature Climb:	. 95°C (203°F)
Cruise CHT:	. 121°C (250°F)
Climb CHT:	. 177°C (350°F)
Climb EGT:	. 650°C (1202°F)
Cruise EGT:	. 690°C (1274°F)
Mechanical Fuel Pump Pressure	. 3 lbs (20 kPa)

Jabiru 3300 Aircraft Engine

15 Engine Installation Checklist

ENGINE MOUNT	AIR INDUCTION SYSTEM
Positions engine for correct aircraft CG	"Cobra Head" fitted
Positions engine for correct thrust line	Duct to carburettor as direct as possible
Sufficient strength	No sharp edges or sharp corners in system
Sufficient stiffness	Carburettor heat system working correctly
Provides access for maintenance	Backfire flap fitted to air box
Provides clearance – the engine and mount are not rubbing on other parts of the aircraft.	Drain holes drilled in air box
	Carburettor sense pipe connected correctly
ENGINE CONTROLS	EGT's evaluated
Control cables bend radii sufficient	EXHAUST SYSTEM
Control cables not rubbing on other parts.	Sufficient clearance – no rubbing on aircraft.
Control cables set up to work in the correct direction	Heat muffs for carb and cabin heat included
	Outlet positioned correctly
ELECTRICAL SYSTEMS	Noise levels satisfactory
Correct sized circuit beakers used	COOLING
Connections for power & earth correct size	Cowl inlet / outlet ratio correct
Correct type of sender units used for instruments (i.e. resistive or voltage type).	Cowl inlets located & shaped correctly
	Cowl outlets located & shaped correctly
Sender units used chosen to suit typical parameter ranges of a Jabiru Engine	Cowl inlets "sealed"
	Crankcase and coil cooling correct
Aircraft grade wiring used.	Pressure differentials correct
CHT cold junction positioned correctly.	Engine temperatures correct
EGT probe located correctly.	
Starter solenoid earthed	
Regulator earthed	
Battery mounted close to the engine	
Anti RF noise measures taken	
FUEL SUPPLY SYSTEM	
Electric backup pump installed	
Electric pump supply pressure within limits	
Fuel line bend radii sufficient	
All fittings fwd of firewall fireproof	
System designed to prevent vapour-lock
